INTRODUCTION

The RAM is essential to access and retrieve memory on a device. A faulty RAM might cause problems while using your computer. This guide will show you how to replace the RAM.

🔧 TOOLS:

- Phillips #1 Screwdriver (1)
- Spudger (1)

Step 1 — RAM

📌 Turn off your computer before starting, and remove the battery.
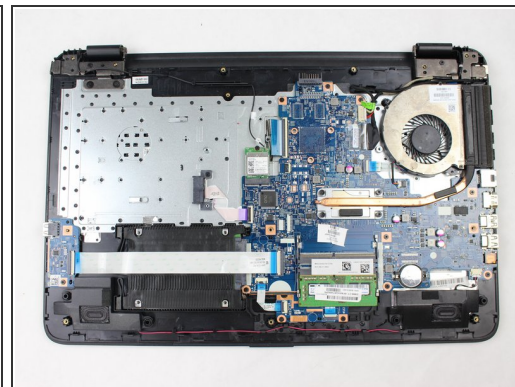

● Locate all 8mm screws on the back of the computer and remove them with the Phillips #1 screwdriver.
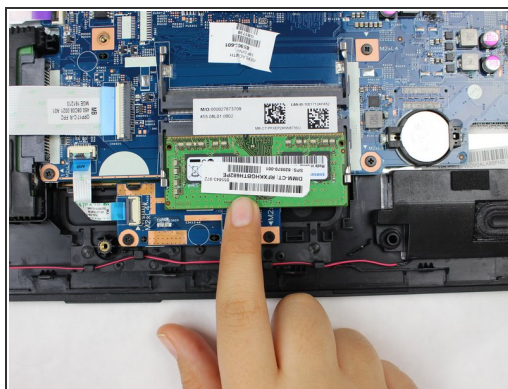

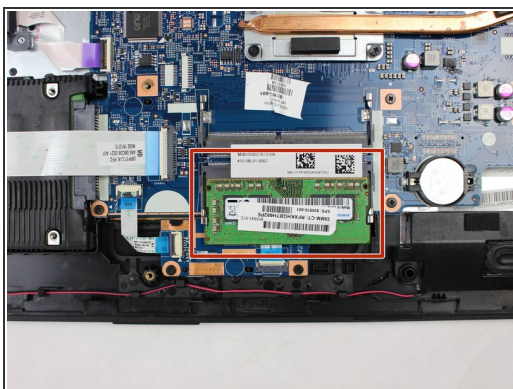

Step 2

● Remove the optical drive by pushing it in and then it will pop out.

Step 3

- Use a spudger to remove the back panel.

Step 4

- Once you remove the back panel, locate the RAM.

- Use your fingernails to release the clips holding the memory by pulling them away from the RAM.

Step 5

- The RAM will pop out, and you can remove it.

To reassemble your device, follow these instructions in reverse order.
