INTRODUCTION

If the battery is running low or does not work any more, use this guide to replace it.

For your safety, discharge your battery below 25% before disassembling your device. This reduces the risk of a dangerous thermal event if the battery is accidentally damaged during the repair. If your battery is swollen, take appropriate precautions.

TOOLS:

- Heavy-Duty Suction Cups (Pair) (1)
- Phillips #00 Screwdriver (1)

PARTS:

• HP Elite X2 1012 G1 Battery (1)

Step 1 — Display

- Be sure to power off and unplug your device before you begin your repair.
 - With the screen face down, lift up the stand as far as it goes.
- Make sure not to force it past the resting point.

Step 2

• Use a T5 driver to remove the six screws on the back of the tablet.

Step 3

- After removing the screws, delicately close the stand.
- Flip the tablet on its back so that the screen is facing up.

Step 4

- Use the suction cup to carefully separate the screen from the device. Pull upwards with a fluid and smooth motion.
- **Do not lift too fast!** There will still be wires connecting the screen to the device. Make sure they are not tampered with.

Step 5

- Remove the tape on the lower left side of the screen.
- Underneath the tape, disconnect the LCM cable, the larger wire that was underneath the tape, from the back of the tablet screen.

Step 6

- Disconnect the flex cable from the device using the spudger.
- Remove the Display Assembly from the device.

Step 7 — Battery

- Use a Phillips #00 screwdriver to remove the seven screws holding the battery in place.
- Five 1.6x2.5 mm and two 1.6x2 screws should be on the battery.

Step 8

- Disconnect the red, white, and black wires and remove the battery from the device.
- (i) Make sure to properly dispose of the dead battery.

To reassemble your device, follow these instructions in reverse order.
