## Step 1 — Battery

- Use two fingers to pull the ridged lock tabs on the bottom of the computer toward the edges. This will unlock the battery.

## Step 2

- Holding the left tab in place, use the groove located between the two tabs to pry the battery up and out.

## Step 3 — CMOS Battery

- Remove the 7mm screw from the back panel using the Phillips head screwdriver.

## Step 4

- Use the spudger to pry the back panel out of the laptop.

## Step 5

- Push the pin that holds the CMOS battery in place downwards. The battery will then come out.

To reassemble your device, follow these instructions in reverse order.
