

HP Pavilion dv7-6178us Hard Drive Replacement

Having trouble with your data storage? You may...

Written By: Zach Lunghi

INTRODUCTION

Having trouble with your data storage? You may need to replace your hard drive. If your personal computer gets a virus, you may need to change the hard drive.

TOOLS:

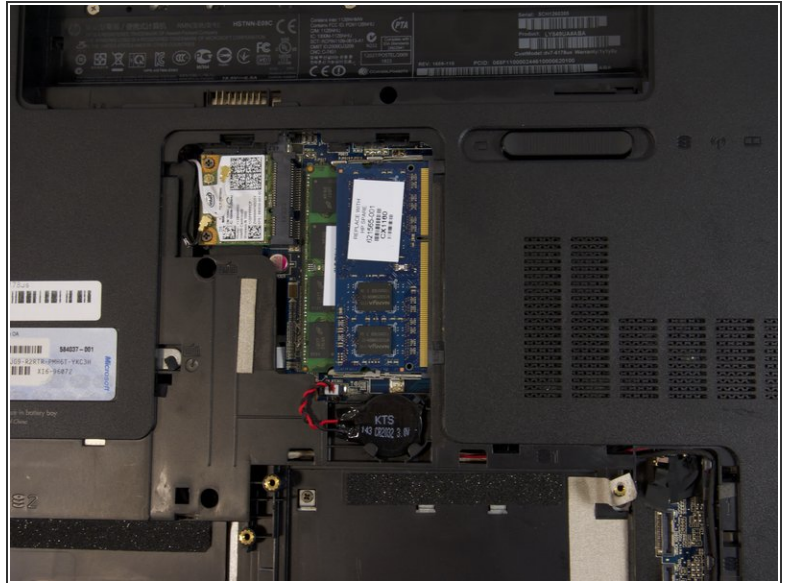

- [Phillips #0 Screwdriver](#) (1)

PARTS:

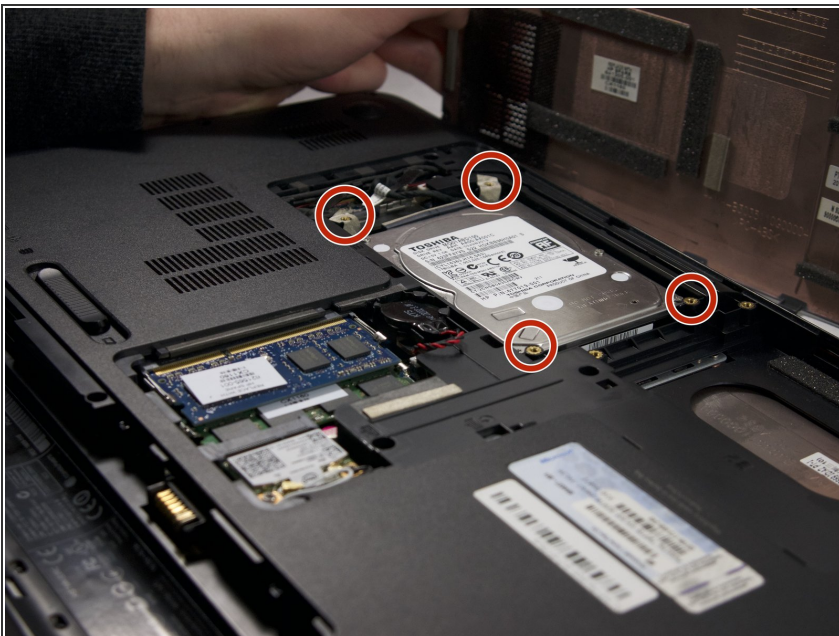

- [1 TB SSD](#) (1)
- [250 GB SSD](#) (1)
- [Crucial MX500 500 GB SSD](#) (1)
- [2 TB SSD](#) (1)

Step 1 — Hard Drive

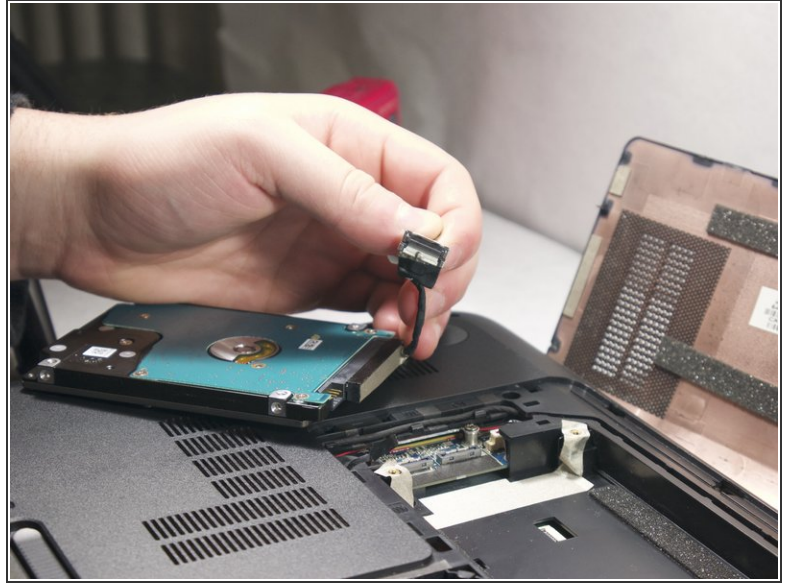

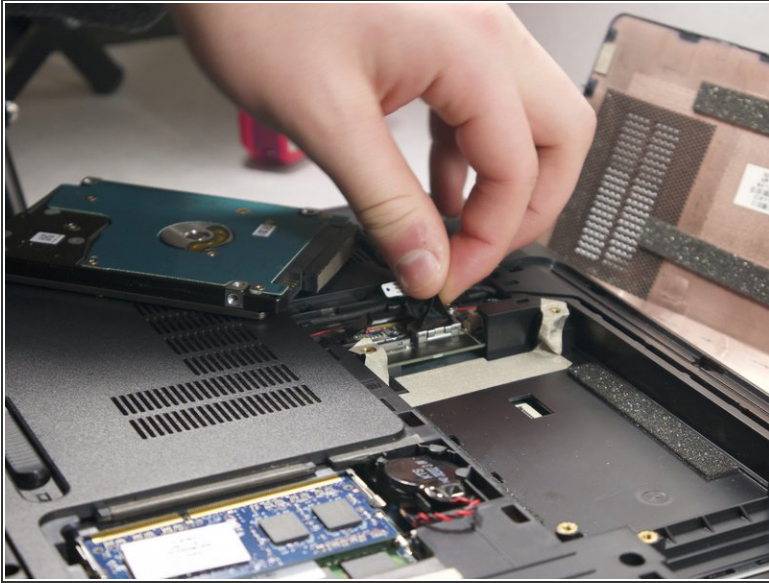

- Flip over the laptop and push the sliding lock to the right (or whichever side indicates it with a symbol.)
- After that is done, carefully pull off the back piece. It should look similar to the second photo.

Step 2

- Now, with the back piece off, you will remove the four screws holding it in place. Use a Phillips head screwdriver.
- ✦ Take note of where you place the screws because you will need them for later.

Step 3

- Place the old hard drive off to the side (as seen in photo) and carefully remove the SATA cable from laptop.

⚠ Be careful to not damage the laptop or cable when doing this step. A gentle pull should do the trick.

To reassemble your device, follow these instructions in reverse order.
