## Step 1 — Back Casing

- Insert a plastic opening tool into the seam between the back casing and the screen to separate the back casing from the tablet.

 You may need to use a metal opening tool for extra prying power, but beware that it can scratch your device or damage the internal components if the tool is inserted too deep.

 You will hear the tabs pop as you separate the back casing around the tablet.

## Step 2

- Lift the back casing away from the rest of the device which should include the exposed circuit board and screen.
- Set the casing aside.

To reassemble your device, follow these instructions in reverse order.
