

# 1986-1993 Volvo 240 Brake Master Cylinder Replacement

Volvo 240 brake master cylinder replacement.

Written By: David Hodson

## INTRODUCTION

If your Volvo 240's brake pedal is especially soft or loses pressure while you're holding the brakes, it could be a bad seal in the master cylinder.

### TOOLS:

- [10 mm Wrench](#) (1)
- [17 mm Socket Wrench](#) (1)

### PARTS:

- [Brake Master Cylinder](#) (1)

*Check an online database or the parts counter at your local auto parts store for the correct model.*

- [Clean Rag](#) (3)

*It's important that the rags are clean to keep dirt and debris out of the brake fluid reservoir.*

## Step 1 — Brake Master Cylinder

- The brake master cylinder is located directly underneath the brake fluid reservoir near the driver side of the engine bay.

## Step 2

- Twist the brake fluid reservoir cap counterclockwise and remove it.
- Remove as much brake fluid from the reservoir as possible by sticking a clean rag inside the reservoir.

 When you remove the rag, be sure not to place it on any painted or plastic surfaces. Brake fluid will strip paint and deteriorate plastic.

### Step 3

- If your brake fluid reservoir has a fluid level sensor, disconnect it by pressing down on the plastic tab and pulling the connector straight out of its socket.

### Step 4

- Use a 10 mm open end wrench to disconnect the two brake lines from the master cylinder.
- ⓘ There will still be fluid in the master cylinder that will drip out of the connections; this is normal. Use a clean rag to clean up any dripping fluid.

## Step 5

- Use an open end or socket wrench to remove the 17 mm nuts on either side of the master cylinder that attach it to the brake booster.
- Remove the brake master cylinder, taking care not to damage or bend the brake lines.

To reassemble your device, follow these instructions in reverse order.

Don't forget to flush & bleed with new brake fluid! (separate how-to required)
